NITRIHIB® – Closed Loop Heating System Treatment

Description: NITRIHIB® is a nitrite-based liquid blend corrosion inhibitor designed for application in closed loop heating systems. It provides corrosion inhibition to iron piping by forming an anodic iron oxide film, this film requires an excess of nitrite to keep replenishing the film that is formed. NITRIHIB® also includes azoles to protect the yellow metal in the system. Added to the blend is an alkaline buffer which adjusts the pH of the systems fluid into the 9.0 - 10.5 range. This aids in the general corrosion protection.

Application & Dosage: Initial dosage of ten litres NITRIHIB® per 1,000 litres system volume for new systems and two-three litres to existing systems. Additions of NITRIHIB® may be required to keep the Nitrite levels in the 800 - 1200 ppm recommended range, as determined by Nitrite test results.
